

Oracular Open Gateway

What is OOGY?

The Oracular Open Gateway (OOGY) offers a stand-alone web-service that enables access to the MOCA layer through standard HTTP based APIs. It provides an integration layer between the BY MOCA layer and any in-house or 3rd party application by exposing MOCA commands via API. Because it is written in Java, you can host the web-service on any OS.

Try a free trial, which will return 10 rows for the command for a single user per instance. Take a look at our installation guide and video on our website to help you through the process!

Download OOGY at

Features:

Stand-alone Web-Service

Integrates BY MOCA layer to other application by exposing MOCA command via API

A single web-service can be used to connect to multiple BY MOCA instances.

Create and integrate existing and new applications with data from your BY WMS instances.
